# COVID-19: Responding to an opioid overdose when using a Take Home Naloxone (THN) kit

The intended purpose of this document is to describe current guidance on how to respond to a suspected opioid overdose when using a Take Home Naloxone (THN) kit in the context of COVID-19. It is prudent in the context of dual public health emergencies in BC that people understand how to safely provide a timely and efficient response to suspected opioid overdoses, including a call to 9-1-1, provision of ventilations, and administration of Naloxone.

The THN face shield will protect against COVID-19. The shield has a one-way valve and large impermeable area that protects the responder from respiratory secretions. The BCCDC continues to promote the use of a THN kit when responding to an overdose in the context of COVID-19, including ventilations with the THN face shield.

### **Overdose Response Protocol:**

- **S** Stimulate: using name, noise, and pain stimulus encourage them to breathe Call 9-1-1
- A Administer Naloxone: put on gloves, prepare Naloxone give 2 doses if needed
- V Ventilations: check & open airway, use THN face shield, 1 breath every 5 seconds
- E Evaluate: check for breathing after 35 breaths any changes to show naloxone is working? (Go to next step if more naloxone is needed if not put in recovery position to monitor)
- M Medicine: administer next dose of Naloxone while providing (or returning) to rescue breaths E Evaluate: check for breathing after 35 breaths; repeat cycle of Naloxone and breaths if needed
- \*If the person's heart stops, with no detectable pulse, compressions only CPR can be initiated, leaving the face shield in place over their mouth to protect yourself from droplets.

#### Know the Response: SAVE ME Steps

S — Stimulate No Response 9-1-1

A — Administer Naloxone 2 Doses if needed

V — Ventilate Every 5 Seconds

E — Evaluate Check for Breath

 $\mathbf{M}-\mathbf{M}$ ore Medicine Administer Naloxone

 ${f E}-{f E}$ valuate & Support Return to Breaths
