

Has a New Stage 2-4 Pressure Ulcer in Long-term Care

Year to Date Performance	3.2%	Performance Assessment	 Red
Island Health Target	Less than or equal to 2.6%	Performance is significantly outside acceptable range; take action and monitor progress.	

What do we measure and why?

Pressure ulcers can develop when a resident sits or lies in the same position for a prolonged period of time. Immobility may be due to many physical and psychological factors, including neurological conditions like Alzheimer's Disease, and improper nutrition or hydration. Careful monitoring is required for good quality care.

This indicator reports the percentage of long-term care residents had a newly occurring stage 2 to 4 pressure ulcer. This indicator is a rolling average of the previous 12 months.

What is the target?

Island Health's target is less than or equal to 2.6%.

Lower rates are better.

How are we doing?

As of the first quarter of 2025/26, Island Health was not yet meeting the target.

What actions are we taking?

Virtual wound care consults improve response time, frequency of follow-up visits, and outreach for residents across Island Health, while also supporting education and wound assessment skills in clinicians. Specialized skin wellness support and training for healthcare staff continues to be rolled out at sites across Island Health.
